Profile

Software engineer with 5+ years shipping web and mobile products. Experience spans healthcare workflows, subscriptions, store releases and framework upgrades, with Laravel API and database work since 2026. Onboards developers to a tested frontend rewrite and uses AI coding agents within team rules, checks and human review.

Experience

Vianova | Frontend & Mobile; Full Stack since 2026

May 2021 - Present | Care-management platform since 2023

- **Laravel APIs and reporting:** tenant data isolation, role checks, timezone fixes, enrollment drafts and a lab catalog. One billing report went from 16 queries to 2 and no longer times out.
- **Care workflows:** device vitals, care plans, labs, billing claims and calls in a platform supporting four languages.
- **Vue-to-React rewrite, in progress:** with a colleague, proposed React with TanStack over a Nuxt 3 upgrade for its ecosystem, developer onboarding and built-in data caching; the team agreed. Both apps are checked against the same scenarios, old bugs are recorded and changes reviewed before approval. Wrote migration rules and checks used by developers and AI agents.
- **Developer onboarding:** led discussions of existing behavior, bugs and slice-by-slice delivery; guided agent use, model selection and orchestration within the shared rewrite process.
- **Design System v2, a team effort:** research and agent guides for a React library with 41 components, automated accessibility checks and 22 releases in 60 days.

Selected web & mobile delivery

- **Bayyinah TV, 2023-2026:** led the decision to rebuild the Nuxt 2 app on Nuxt 3 with a cleaner structure; live streams, chat, subscriptions and English/Arabic support. One web app serves the browser and both store apps.
- **Read to Feed, 2022-2025:** about 14 store releases and three major React Native upgrades. Maintained PDF/EPUB library forks, including a native WebView change for Android font rendering.

Freelance contracts

- **Incentiv, 2024:** built most of the Next.js portal frontend, from passkey sign-in and onboarding to the dashboard. Teammates built the wallet and blockchain integration.
- **AvahiTech, 2024:** React dashboard with AI headshot generation and document chat; backend features in Python/FastAPI.

Independent products

- **Tondo:** Node.js multiplayer game, deployed on Render. The server validates moves and sends state over WebSockets; PostgreSQL stores saved crews. Public source code.
- **Offday:** co-built a Next.js/SQLite time-off app with server-side roles and organization boundaries. About 200 Playwright tests. Working MVP.
- **LeakScan:** built alone, pre-launch. Security scans with domain-ownership checks, reports and rescans; encrypted credentials with expiry and owner deletion. Next.js, Postgres/PGlite, Drizzle.

Technical skills

Frontend & mobile: TypeScript, React, Next.js, Vue/Nuxt, React Native, Tailwind CSS, Bootstrap, iOS/Android releases

State & server data: Redux / Redux Toolkit, Zustand, Pinia, Vuex, TanStack Query

Backend & data: Node.js, PHP/Laravel, MySQL, PostgreSQL, Redis, REST APIs, WebSockets

Quality: Zod, Playwright, Vitest, Pest, Storybook, axe, CI checks, AI-assisted development and review

Integrations: Stripe, Firebase, Twilio, Pusher, AWS IVS, Cloudinary (images). Hosting on Render; AWS file uploads and troubleshooting; exposure to EC2 deployments.

Languages: Albanian (native), English
